

Unemployment Analysis with Python

Aim

To analyze unemployment trends in India using Python and visualize the impact of COVID-19.

Software Requirements

Python, Pandas, NumPy, Matplotlib, Seaborn, Jupyter Notebook

Dataset

Unemployment in India.csv and Unemployment_Rate_upto_11_2020.csv

Procedure

1. Import libraries. 2. Load dataset. 3. Clean data. 4. Perform exploratory data analysis. 5. Create visualizations. 6. Analyze COVID-19 impact. 7. Draw conclusions.

Results

Unemployment peaked during April–May 2020. COVID-19 significantly affected employment rates. Regional variations were observed across India.

Conclusion

Python provides effective tools for analyzing unemployment data and identifying trends that can support economic planning and decision making.
